

**Don't STRUGGLE with a call pendant.
We can give you
BETTER ACCESS to call systems**

Technical Solutions offer a range of special switches to suit the needs of people with a physical impairment. We can also supply a special interface that is usually required in order to connect these special switches into a call system.

The type of interface will vary – often custom made by Technical Solutions to suit the particular system. Many modern call systems require a simple “Interface Lead”, an adaptor with a plug to suit the call system and a socket to suit our switches. Older call systems and those with large multi-pin plugs on the call pendant lead will require a more elaborate electronic Hospital Call Interface.

Hospital/Nurse Call Interfaces:

We have a range of Hospital Call Interface adaptors that allow any of our light pressure switches to be used with most hospital and nursing home call systems, including the older multi-wire system. Some models feature an intention delay that helps avoid false alarms caused by brief bumps on the call switch. And some have an ‘ECU’ output so that the user can use a single switch to access an environment control or communication device as well as the call system.

A Technical Solutions consultant can talk to your technician or maintenance person to ascertain the correct interface for your establishment. Note that we may need you to send us an example of a working call pendant lead for assessment and/or modification.
