

Multi Station Call System/Intercom Monitor

(For supported accommodation)

Cat. Number: INT-TS2- (M & I)

Introduction

The system can comprise *Monitor Stations* in the clients' bedrooms as well as *Monitor Stations* that monitor activity in corridors or living areas.

Master Stations are usually located in the carer's room and kitchen. These are used to monitor the clients' activities and communicate with clients. The corridor monitor station can be fitted with a motion detector, which can be useful for monitoring nighttime wanderers. All *Monitor Stations* have adjustable automatic 'noise detection' that will activate the monitor when noise in a client's room exceeds a predetermined level.

- Clients can activate the call system either by voice/sound or by activating a special switch suited to their physical abilities.
- We provide Jellybean Switches with the system as these switches are very 'accessible' and very reliable - Many other switches are available as optional extras to suit clients with very limited movement.
- Alarm trigger sound levels can be adjusted so that the carer will not be disturbed by soft background noises such as snoring.
- The *Master Station* will be quiet, allowing the carer to sleep, till there is a disturbance and the alarm beep tone is activated.
- The system identifies which room has caused the alert and automatically initiates monitoring.
- The carer can manually monitor any room at any time.
- The carer can initiate an intercom conversation with any room at any time.
- The client *Intercom Stations* have hands free operation, whereas the carer's *Master Station* has 'press to talk' functionality.
