Information Sheet

Radio Switch Link

26MHz version

Catalogue Number: RL-BR

This unit provides a cordless radio link between your **Big Red** switch and the device to be operated. The switch is fitted with a small yet powerful radio transmitter that will operate over distances of up to 20 Metres*.

Easy To Set Up:

- Simply plug the **receiver** power supply into a 240Volt power point.
- And plug the switch lead from the receiver into the toy or device that you wish to operate.
- Select either the momentary or latching switch output, this will depend on the device you wish to control.
- The **transmitter** in the **Big Red** switch requires an Alkaline 9Volt battery. (There is a battery compartment in the base of the **Big Red** switch). If the user wishes to use a different switch to operate the transmitter, there is a socket in the base to plug in another switch, which will also disable the big red switch.

Tests:

- The **small Blue light** on the base of the **Big Red** switch should light when the switch is operated. The light will also indicate when the battery is getting flat, when it starts to flash replace the battery.
- A soft click sound should be heard from the Radio Linked Switch **receiver** when the **Big Red** switch is operated. If it doesn't click, check the power supply.

* The range will be dependent on environmental factors.
