

Scanning Bed Controller

Catalogue Number: SBC

The *Scanning Bed Controller*
gives people with disabilities
complete control over an Adjustable Bed

This device developed by Technical Solutions gives people with extremely limited movement full control over an Adjustable Bed. The *Scanning Bed Controller* (SBC) uses a specially designed scanning sequence to operate all bed movements with a single switch.

Simply clicking the super light touch *Specs Switch* (yellow switch shown right attached to our *Bed Switch Mount*) will start the lights on the *Scanning Bed Controller* scanning across the options. The Scanning sequence efficiently guides a user through a menu, which selects the part of the bed to be moved, and then offers, a choice of up or down. The scanning speed can be adjusted to suit the user. The Specs Switch can be operated with very minor movements of the user's head, hand or any part of the body.

Many Switch Options Available

Technical Solutions has an extensive range of special switches to provide accessibility for people with disabilities.

Infrared Activation

Our *Scanning Bed Controller* also features an infrared interface so that an Adjustable Bed can be controlled directly from an infrared remote control. When used in conjunction with one of the special Environment Controllers available from Technical Solutions, the *Scanning Bed Controller* can form part of a complete Home Environment Control System - giving people with disabilities control over many devices in their home.
